Title: THE STRENGTH OF METAL POWDER FILTERS AT LOW TEMPERATURES  
Periodical: *Poroshkovaya metallurgiya*, no. 1(7), 1962, 65-67  
Text: A simple and reliable device for testing metal powder filters is described. New experimental data on the strength of nickel powder filters at low temperatures (up to -196°C) have established a substantial increase in the strength of nickel powder materials with decreasing temperature. There are 2 figures and 1 table.

TITLE: Some data on the influence of temperature on the strength and plasticity of refractory compounds

PERIODICAL: Poroshkovaya metallurgiya, no. 2, 1962, 87-91

TEXT: The investigation of physicochemical properties of refractory compound-base alloys in a wide temperature range is necessitated by their increasing use as constructional materials at elevated temperatures. This work investigates the regularity of variation of strength of titanium carbide, molybdenum carbide and zirconium boride under short-time static loads at temperatures from 20°C to 2500°C. Titanium and molybdenum carbides were found to have a maximum bending strength at 0.6 of their melting points. The plasticity of titanium carbide was found to increase with temperature and to reach considerable values at 2200–2400°C, while molybdenum carbide and zirconium boride showed no such effect. There are 5 figures.

The long time modulus is maximum at 24° C. and decreases at higher temperatures. The  $E$  modulus at 24° is about 10 times greater than at 100°. The maximum modulus is attained at 24° C. and decreases with increasing temperature. The effect of temperature on the shear modulus is similar.

ABSTRACT: An experimental testing chamber for testing the mechanical properties of  
high-melting metals in a vacuum and in an inert medium at high temperatures has been  
developed (see Fig. 1). The temperature dependence of the modulus of elasticity,  
strength limit, and hardness limit of tungsten and molybdenum were determined. The  
experimental results are presented graphically (see Fig. 2). It was found that the  
strength and hardness limit obeyed the expressions of Frantsevich-Vrontskiy and

TITLE: Evaluation of the loss of kinetic energy of fluid flow in tubes

SOURCE: Inzhenerno-fizicheskiy zhurnal, v. 9, no. 3, 1965, 384-390

TOPIC TAGS: thermodynamics, irreversible process, chemical separation

ABSTRACT: Using the methods of the thermodynamics of irreversible processes it is possible to establish the main characteristics of flows of liquids in channels with constant and changing cross sections. Generalized experimental data have permitted the determination of optimal conditions in the operation of a separation column. The present article uses this method to evaluate the loss of kinetic energy of a moving gas in a tube with injection of a homogeneous gas. The mathematical treatment of the problem is carried through in cylindrical coordinates. A figure shows the calculated change in the relative velocity for different rates of gas injection. The velocity drop along the length of the tube decreases with an

Card 1/2

L 1988-66

ACCESSION NR: AP5022390

increase in the blowing (injection) rate and, with large consumptions of the injected gas, the velocity also increases along the length. For the calculation, the velocity of the air flow was taken as 100 meters/sec and the air density was taken to correspond to a temperature of 300 K. Orig. art. has: 23 formulas and 2 figures

TITLE: The effect of coolant injection on heat transfer and friction in the turbulent boundary layer  
SOURCE: Inzhenerno-fizicheskiy zhurnal, v. 9, no. 6, 1965, 816-833  
TOPIC TAGS: heat transfer, cooling, transpiration cooling, nozzle cooling  
ABSTRACT: One of the most effective means for protecting walls from the effect of high temperature gases is transpiration cooling effected by injection of liquids or gases through the porous wall into the boundary layer. This subject is reviewed in the present survey article which covers a total of 86 studies including 35 Soviet works. Cases with chemical reaction in the boundary layer are not considered. Among the Soviet studies reviewed, the following articles deserve mentioning: Three theoretical studies by Motulevich, in which transpiration cooling is analyzed and the integration of the boundary layer equations is attempted. Kutateladze presented analyses, made with the assumption that the sublayer is destroyed and that boundary layer conditions are similar to those at an infinite Reynolds number. These studies yielded relationships for the friction and heat transfer coefficients as a function of the intensity of the coolant injection. Romanenko studied the injection of air,

L 11654-66

ACC NR: AP6002006

helium, carbon dioxide, and freon-10 into a subsonic turbulent boundary layer on a porous copper plate experimentally. Mugalev's studies with the injection of air and other gases through a porous plate into a sub- or supersonic air stream included methods for calculating the heat and mass transfer. Sergeev studied the intensification of heat transfer by use of coolants, such as water, acetone, benzene, and butanol, which evaporate. Equations for calculating the heat and mass transfer during the evaporation of liquids from porous ceramic plates were derived. Isachenko studied cooling by injecting water through a porous copper plate, and Fedorov measured velocity and temperature fields when water is injected through a porous ceramic plate. Orig. art. has: 5 figures and 20 formulas.

TOPIC TAGS: epitaxial silicon, silicon semiconductor, metal silicon film

ABSTRACT: Epitaxial films produced by hydrogen reduction of silicon tetrachloride on silicon backing were studied. A stable phosphorus isotope introduced in the source tetrachloride as  $\text{PCl}_3$  was reduced by hydrogen and, along with the silicon, passed to the epitaxial layer. The resulting doped epitaxial films were irradiated with thermal neutrons of  $10^9$  per  $\text{cm}^2$  density in a reactor channel. The stable phosphorus isotope was turned into radioactive  $\text{P}^{32}$  whose distribution in the film was studied in a single-channel B-2 analyzer by the method of taking off the layers. The nature of the resulting distribution curves is discussed. From the author's abstract.

TOPIC TAGS: silicon, epitaxial growing, semiconducting film, tracer study, neutron irradiation, thermal neutron/ B-2 single channel analyzer

ABSTRACT: A radioactive tracer method was used to investigate the distribution of P in epitaxial films obtained by hydrogen reduction of silicon tetrachloride on Si substrates. A stable isotope of P, introduced in the initial tetrachloride in the form of  $\text{PCl}_3$ , was reduced with hydrogen and carried together with the Si into the epitaxial layer. The films were irradiated by a flux of thermal neutrons with density  $10^9 \text{ cm}^{-2}$ . The stable isotope of P then went over into the radioactive isotope ( $\text{P}^{32}$ ), whose distribution in the body of the film was investigated by the removal-of-layers method, using a single-channel B-2 analyzer. The character of the distribution curves obtained by this method is discussed. [Translation of abstract]

TITLE: Diffusion of phosphorus in epitaxial silicon

SOURCE: AN UzSSR. Izvestiya. Seriya fiziko-matematicheskikh nauk, no. 1, 1966, 85-86

TOPIC TAGS: epitaxial growing, single crystal, phosphorus, silicon

ABSTRACT: The authors investigated the diffusion of phosphorus in epitaxial layers of silicon grown from the gas phase by means of the reaction of hydrogen reduction of silicon chloride. The experiments were performed on single crystal films with a specific resistance of the order of 90 ohm·cm grown at 1200C on silicon base layers. The results show that the phosphorus diffusion coefficient in epitaxial film at 1000C is  $3 \cdot 10^{-12}$  cm<sup>2</sup>/sec, and differs considerably from the phosphorus diffusion coefficient at the same temperature in single crystals of silicon ( $3 \cdot 10^{-14}$  cm<sup>2</sup>/sec). This, apparently, is related to the characteristics of the structure of epitaxial films. Orig. art. has: 1 figure.

APR 1995

The 400-25,000 revolts in the 100 rpm range resulted in the minimal value. There was little wear on the carbon studler at 100 rpm. It showed the coefficient of friction to be the least at 30-40 rpm. Its coefficient of friction increased as the speed increased from 0.5-1.5 m/sec. The number of cycles for the loss of friction and wear on the carbon studler was 1-53 rpm and the least wear of all the materials tested. (See Art. Ref. 5 in tables.

TITLE: Improving the durability of chrome-plated piston rings

SOURCE: IVUZ. Mashinostroyeniye, no. 4, 1966, 59-63

TOPIC TAGS: engine piston, engine cylinder, carburization, chromium plating

ABSTRACT: Methods are proposed for increasing the wear resistance of the upper piston rings in tractor engines by carburizing the chrome-plated surface. The surfaces of the rings and cylinder were knurled before chrome plating. The knurl depressions were tetrahedral pyramids with a base of  $0.5 \times 0.5$  mm located 2 mm apart with a depth of 0.18-0.25 mm. After chrome plating, the rings were chemically heat treated in a solid carburizer of the following composition: carbon--50%,  $\text{Na}_2\text{CO}_3$ --20%, Fe (filings)--30%. The heat treatment was continued for 5 hours at  $950^\circ\text{C}$ . X-ray structural analysis showed a gray layer of chromium carbide on the metal surface. This layer was  $60-80 \mu$  thick and was not etched by a 3-4% solution of  $\text{HNO}_3$  or a 15-20% solution of HCl. The carbide layer is heat- and acid-resistant with a hardness of  $1400-1600 \text{ kg/cm}^2$ . It was found that carburization increases the service life of chrome-plated piston rings by a factor of 1.3-2.2. The article was presented for publication by A. I. Pogorelov, Lecturer at Kharkov Municipal Engineering Institute. Orig. art. has: 3 figures. 1 table.

TITLE: Wave dispersion in a helix of rectangular cross-section

SOURCE: Izvestiya vysshikh uchebnykh zavedeniy, radiofizika, v. 6, no. 2,  
1963, 373-379

TOPIC TAGS: wave dispersion, helical delay system

ABSTRACT: The hitherto known theory of the rectangular helix used as a delay system (in microwave tubes) has covered only the case when one wave-length extends over a few turns and the current-phase variation within one turn can be neglected. However, if such a delay system is used in a TW tube, the phase within one turn will change materially; hence, the field distribution over the cross-section will be asymmetrical. The article investigates mathematically the dispersion properties of a rectangular helix in the case of asymmetrical waves. An integro-differential dispersion equation is developed for the waves propagating between two aniso-tropically conducting planes. Then a dispersion equation is derived for symmetrical and asymmetrical wave in a rectangular

strength, martensite

ABSTRACT: This Author Certificate introduces a method of strengthening structural and  
tool steels, which consists of annealing followed by quenching to provide  
martensite, low tempering, and deformation, followed by low-temperature  
aging. To increase the steel yield strength, the deformation is done by  
compression. [ND]

KHARCHEVNIKOVA, A. V.

High-molecular weight compound. XV. Products of polycondensation of 1,2-dichloroethane with benzene. V. V. Korshak, G. S. Kolesnikov, and A. V. Kharchevnikova (Mendeleev Chem. Tech. Inst., Moscow). J. Gen. Chem. (U.S.S.R.) 18, 103-204 (1948) (in Russian). — The reaction of  $C_6H_6$  and  $(CH_2Cl)_2$  in the presence of  $AlCl_3$  was shown to be affected by variation of the relative amounts of the components. Oxidation of the polyphenylethyl (polycondensation product) by Cr oxide gives terephthalic acid, indicating that the polymer is made of Ph nuclei joined by  $CH_2CH_2$  links in para positions.  $C_6H_6$  (264 g.) and 50 g.  $(CH_2Cl)_2$  were treated with 07.4-0.7 g.  $AlCl_3$  4.5 hrs. on a steam bath; the yield of the polymer dropped with smaller amounts of  $AlCl_3$  (from 37.7 g. to 15 g.) but its nature was not changed; it was still a homogeneous mass, sol. in  $C_6H_6$ . In a 2nd series the  $AlCl_3$  and  $C_6H_6$  were held const. (amounts not given) while the  $(CH_2Cl)_2$  was varied from 25 g. to 500 g. (mol. ratio to  $C_6H_6$  from 13.5 to 0.07); as the amt. of the dichloride increases, the amt. of  $(Ph-CH_2)_2$  drops and reaches zero at mol. ratios below 1 (the reaction time had to be reduced from 4.5 hrs. to 1-2.5 hrs. in these runs because of excessive foaming); the amt. of the polymer, however, constantly rises, from 0.2 g. to 300 g. Only when the ratio of  $C_6H_6$  to the dichloride drops lower than 1.1 does the polymer change its properties; it becomes insol. in  $C_6H_6$ . The mol. wt. of the polymer (by viscosity in benzene) remains in the 1200-1300 range until

the above ratio reaches 1.68, when the mol. wt. of the product climbs to 2100. When the polymer (3-7 g.) was boiled / 48 hrs. with 50 g.  $H_2O_2$ , 100 g.  $H_2SO_4$ , and 40 g.  $K_2Cr_2O_7$ , only terephthalic acid was isolated. This also occurred when the benzene-insol. polymer was oxidized. The formation of the insol. polymer is readily explained by the fact that with the proportions used all the  $C_6H_6$  reacts to form the polymer and the latter is then able to condense further with the dichloride through reaction in the ortho position, leading to 3-dimensional mols. by cross linking.

ABSTRACT: Data obtained at nine ozonometric stations between the Arctic and the subtropics during the IGY and IGC on variations in the amount of ozone in the atmosphere indicate that there are definite correlations between the amount of ozone in the atmosphere and different types of fronts and synoptic situations. Thus, the amount of ozone in the atmosphere was found to vary with the passage of a

Card 1/2

L 01803-66

ACCESSION NR: AT5021765

cold, warm, or occluded front in various positions relative to a given station. The author proposes that variations in the amount of ozone in the atmosphere may be used as a criterion in forecasting fronts and in determining frontal circulation more accurately. Data obtained in July—September 1963 at Abastumani on the correlation between variations in the amount of ozone and the temperature in the troposphere and lower stratosphere are cited to corroborate the author's contention that a drop in temperature in the troposphere is accompanied by an increase in the amount of ozone in the atmosphere. ... cyclones was at latitudes 40—50° N and the minimal at 30—40° N. For anticyclones the maximal deviation was at 40—70° N and the minimal at 70—80° N. In Europe the

ACC NR: AT7001922

deviation of total content of ozone in cyclones is less than in Asia. For anti-cyclones the deviation is less in Asia than in Europe. The author considers vertical air motions to be the principal cause of the deviation: the total content of ozone increases in an upper-level cyclone as a consequence of descending air currents and it decreases in an upper-level anticyclone as a consequence of ascending air currents. Orig. art. has: 2 tables and 1 figure.

TOPIC TAGS: cyclone, anticyclone, atmospheric ozone

ABSTRACT: Results of investigations of the deviation of the total content of ozone  
in the atmosphere in high cyclones and anticyclones are discussed. Statistical data  
showed that in most cases, the total content of the atmospheric ozone increases  
in high cyclones and decreases in high anticyclones. The latitudinal and seasonal  
course of the deviation of total content of the ozone was obtained, as well as con-  
tinental variations in the deviation of total content of ozone in high cyclones and

ACC NR: AT7004235

anticyclones. The qualitative characteristics of vertical air velocity in high cyclones and anticyclones is discussed. Orig. art. has: 7 figures and 5 tables.
